Disclaimer

SolidProof.io reports are not, nor should be considered, an “endorsement” or “disapproval” of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any “product” or “asset” created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc’...)

SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof’s position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

Description

Pawn My NFT provides a safe BSC token to invest in, with liquidity locked, low tax, no reflections, and no rewards.

Project Engagement

During the 5th of January 2022, **Pawn My NFT Team** engaged Solidproof.io to audit smart contracts that they created. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the contracts. They provided Solidproof.io with access to their code repository and whitepaper.

Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
Critical	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
High	7 – 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon aspossible.
Medium	4 – 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
Low	2 – 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
Informational	0 – 1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk

Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

Methodology

The auditing process follows a routine series of steps:

1. Code review that includes the following:
    i) Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
    ii) Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
    iii) Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.

2. Testing and automated analysis that includes the following:
    i) Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
    ii) Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.

3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.

4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

Used Code from other Frameworks/Smart Contracts (direct imports)

Imported packages:

Tested Contract Files

This audit covered the following files listed below with a SHA-1 Hash.

A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.

v1.0

File Name	SHA-1 Hash
contracts/PawnMyNFTMortgage.sol	12b218520395b3cae263769556ea5925a7fc6eb9

Capabilities

Components

Version	Contracts	Libraries	Interfaces	Abstract
1.0	3	2	0	0

Exposed Functions

This section lists functions that are explicitly declared public or payable. Please note that getter methods for public stateVars are not included.

Version	Public	Payable
1.0	27	0
1.1	28	0

Version	External	Internal	Private	Pure	View
1.0	10	29	0	10	13
1.1	11	30	0	10	13

State Variables

Version	Total	Public
1.0	16	11
1.1	17	12

Capabilities

Version	Solidity Versions observed	Experimental Features	Can Receive Funds	Uses Assembly	Has Destroyable Contracts
1.0	`0.8.4`			`yes` (1 asm blocks)	

Version	Transfers ETH	Low-Level Calls	DelegateCall	Uses Hash Functions	ECRecover	New/Create/Create2
1.0				`yes`	`yes`	

Scope of Work

The above token Team provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:

1. Correct implementation of Token standard
2. Deployer cannot mint any new tokens
3. Deployer cannot burn or lock user funds
4. Deployer cannot pause the contract
5. Overall checkup (Smart Contract Security)

Write functions of contract

Deployer cannot burn or lock user funds

File	Name	Exist	Tested	Verified
PawnMyNFT	cannot lock	✓	✓	✓
	cannot burn	✓	✓	✗
PawnMyNFTMortgage	cannot lock	✓	✓	✗
	cannot burn	✓	✓	✗

Comments:

v1.0

- Deployer can set maximumLoanDuration to the lowest
- Deployer can set platformFee up to 1000
    - There is not limitation downwards
- Deployer can lock by pausing the contract

Deployer cannot pause the contract

File	Name	Exist	Tested	Verified
PawnMyNFT	Deployer cannot pause	✓	✓	✗
PawnMyNFT Mortgage	Deployer cannot pause	✓	✓	✗

Comments:

v1.0

- Deployer can pause contract
  - Following functions are not callable if contract is paused by the owner
    - PawnMyNFTMortgage
      - lend
      - Payback
    - PawnMyNFT
      - _beforeTokenTransfer
        - That function is used in ERC721 following functions
          - _mint
          - _burn
          - _transfer

nLines	normalized lines of the source unit (e.g. normalizes functions spanning multiple lines)
nSLOC	normalized source lines of code (only source-code lines; no comments, no blank lines)
Comment Lines	lines containing single or block comments
Complexity Score	a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces, ...)

Audit Results

AUDIT PASSED

Critical issues

- no critical issues found -

High issues

- no high issues found -

Medium issues

- no medium issues found -

Low issues

Issue	File	Type	Line	Description
#1	PawnMyNFTMortgage	Local variables shadowing	100	Rename the local variables that shadow another component _status to status_

Informational issues

Issue	File	Type	Line	Description
#1	Pawn	Functions that are not used	38	Remove unused functions
#2	PawnMyNFTMortgage	Misspelling	70	Change nfnftTokenId to nftTokenId in event
#3	PawnMyNFTMortgage	Naming convention	159	If you using mixedCase naming convention, then continue to use it with all other variables Recommendation: Change _erc721Anderc20contracts to _erc721AndErc20Contracts

#4	Pawn	Imported files were not used	6, 12	Imported files were not used in the code - SafeMath (already implemented in pragma versions above 0.8.0) - IERC721 (It's already implemented in ERC721)
#5	Locker	Imported files were not used	4, 6	Imported files were not used in the code - IERC20 - SafeERC20
#6	Pawn	Unnecessary import	12	You don't need to import SafeMath in solidity pragma version greater than 0.8.0 It's already imported in those versions
#7	PawnMyNFTMortgage	Brackets	445	Brackets can be removed from number 1000
#8	PawnMyNFTMortgage	Uppercase/Lowercase message start	-	Either you start with lower case letters or with upper case letters Compare: "liquidateLoan:: Not yet overdue", line 344 with "ExtendLoan:: Oops repaid or liquidated already", line 380 (extendLoan function started with lower case letters)

Audit Comments

09. January 2022:

- Please fix import issues because it seems that it was only copy pasted in several files
    - Read informational issues above for more information
- PawnMyNFTMortgage must have allowance to spent tokens/nfts in loan contract for payback/lend function
    - Deployer can lock those functions by enable pausing state variable

- Read whole report for more information
- Beneficiary address

13. January 2022:

- Beneficiary address was added
- platformFee was modified from 25 to 250
- Event was added
  - BeneficiaryUpdated
- Function was added
  - updateBeneficiary
