# Disclaimer

SolidProof.io reports are not, nor should be considered, an “endorsement” or “disapproval” of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any “product” or “asset” created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc’...)

**SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.**

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof’s position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

Version	Date	Description
1.0	13. January 2022	<ul style="list-style-type: none"><li>• Layout project</li><li>• Automated- /Manual-Security Testing</li><li>• Summary</li></ul>

## **Network**

Binance Smart Chain (BEP20)

## **Website**

<https://unipad.world/#>

## **Telegram**

<https://t.me/UnipadGroup>

## **Twitter**

<https://twitter.com/UniPadAnnounce>

## Description

The platform helps investors easy to purchase private sale/public sale and sell their tokens before they list on other centralized or decentralized exchanged

## Project Engagement

During the 11th of January 2022, **UniPad Team** engaged Solidproof.io to audit smart contracts that they created. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the contracts. They provided Solidproof.io with access to their code repository and whitepaper.

## Contract Link v1.0

- <https://bscscan.com/address/0xFafa7e84a4c7Fb9BBefD1E98a3c3125586f4C846#code>

# Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
<b>Critical</b>	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
<b>High</b>	7 – 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon as possible.
<b>Medium</b>	4 – 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
<b>Low</b>	2 – 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
<b>Informational</b>	0 – 1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk

# Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

## **Methodology**

The auditing process follows a routine series of steps:

1. Code review that includes the following:
  - i) Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
  - ii) Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
  - iii) Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.
2. Testing and automated analysis that includes the following:
  - i) Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
  - ii) Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

## Used Code from other Frameworks/Smart Contracts (direct imports)

Imported packages:

```
IBEP20  
Auth  
IDEXFactory  
IDEXRouter  
📦 SafeMath  
IDividendDistributor  
DividendDistributor
```

## Tested Contract Files

This audit covered the following files listed below with a SHA-1 Hash.

*A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.*

### v1.0

File Name	SHA-1 Hash
contracts/unipad.sol	d0974c1c5ed919b5fd5fbbb9f6ef85d947f400a0

# Metrics

## Source Lines v1.0

## Risk Level v1.0

## Capabilities

### Components

Version	Contracts	Libraries	Interfaces	Abstract
1.0	2	1	4	1

### Exposed Functions

*This section lists functions that are explicitly declared public or payable. Please note that getter methods for public stateVars are not included.*

Version	Public	Payable
1.0	62	5

Version	External	Internal	Private	Pure	View
1.0	49	63	0	11	22

### State Variables

Version	Total	Public
1.0	61	24

### Capabilities

Version	Solidity Versions observed	Experimental Features	Can Receive Funds	Uses Assembly	Has Destroyable Contracts
1.0	<code>^0.7.4</code>		yes	**** (0 asm blocks)	

Version	Transfers ETH	Low-Level Calls	DelegateCall	Uses Hash Functions	ECRecover	New/Create/Create2
---------	---------------	-----------------	--------------	---------------------	-----------	--------------------

1.0	yes					yes → New Contract:Divide ndDistribu tor
-----	-----	--	--	--	--	--

## Scope of Work

The above token Team provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:

1. Correct implementation of Token standard
2. Deployer cannot mint any new tokens
3. Deployer cannot burn or lock user funds
4. Deployer cannot pause the contract
5. Overall checkup (Smart Contract Security)

## Inheritance Graph v1.0

## Verify Claims

### Correct implementation of Token standard

Tested	Verified
✓	✓

Function	Description	Exist	Tested	Verified
TotalSupply	provides information about the total token supply	✓	✓	✓
BalanceOf	provides account balance of the owner's account	✓	✓	✓
Transfer	executes transfers of a specified number of tokens to a specified address	✓	✓	✓
TransferFrom	executes transfers of a specified number of tokens from a specified address	✓	✓	✓
Approve	allow a spender to withdraw a set number of tokens from a specified account	✓	✓	✓
Allowance	returns a set number of tokens from a spender to the owner	✓	✓	✓

## Write functions of contract

1. approve

2. approveMax

3. authorize

4. clearStuckBalance

5. cooldownEnabled

6. setDistributionCriteria

7. setDistributorSettings

8. setFeeReceivers

9. setFees

10. setIsDividendExempt

11. setIsFeeExempt

12. setIsTimelockExempt

13. setIsTxLimitExempt

14. setMaxWalletPercent

15. setSwapBackSettings

16. setTargetLiquidity

17. setTxLimit

18. transfer

19. transferFrom

20. transferOwnership

21. unauthorize

## Deployer cannot mint any new tokens

Name	Exist	Tested	Verified
Deployer cannot mint	—	—	—

Max / Total Supply: 1.000.000.000

## Deployer cannot burn or lock user funds

Name	Exist	Tested	Verified
Deployer cannot lock	✓	✓	✗
Deployer cannot burn	–	–	–

Comments:

### v1.0

- Deployer can lock user funds
  - by setting `_maxWalletToken` to 0 and if recipient holds more than 0 tokens
  - By enabling `buyCoolDown` and set `cooldownTimerInterval` to a high value
  - By setting `_maxAmount` to 0

## Deployer cannot pause the contract

Name	Exist	Tested	Verified
Deployer cannot pause	—	—	—

## Overall checkup (Smart Contract Security)

Tested	Verified
✓	✓

### Legend

Attribute	Symbol
Verified / Checked	✓
Partly Verified	🚩
Unverified / Not checked	✗
Not available	—

## Modifiers

◆ setMaxWalletPercent

Ⓜ onlyOwner

◆ cooldownEnabled

Ⓜ onlyOwner

◆ setTxLimit

Ⓜ authorized

◆ setIsDividendExempt

Ⓜ authorized

◆ setIsFeeExempt

Ⓜ authorized

◆ setIsTxLimitExempt

Ⓜ authorized

◆ setIsTimelockExempt

Ⓜ authorized

◆ setFees

Ⓜ authorized

◆ setFeeReceivers

◆ setSwapBackSettings

Ⓜ authorized

◆ setTargetLiquidity

Ⓜ authorized

◆ setDistributionCriteria

Ⓜ authorized

◆ setDistributorSettings

Ⓜ authorized

◆ authorize

Ⓜ onlyOwner

◆ unauthorize

Ⓜ onlyOwner

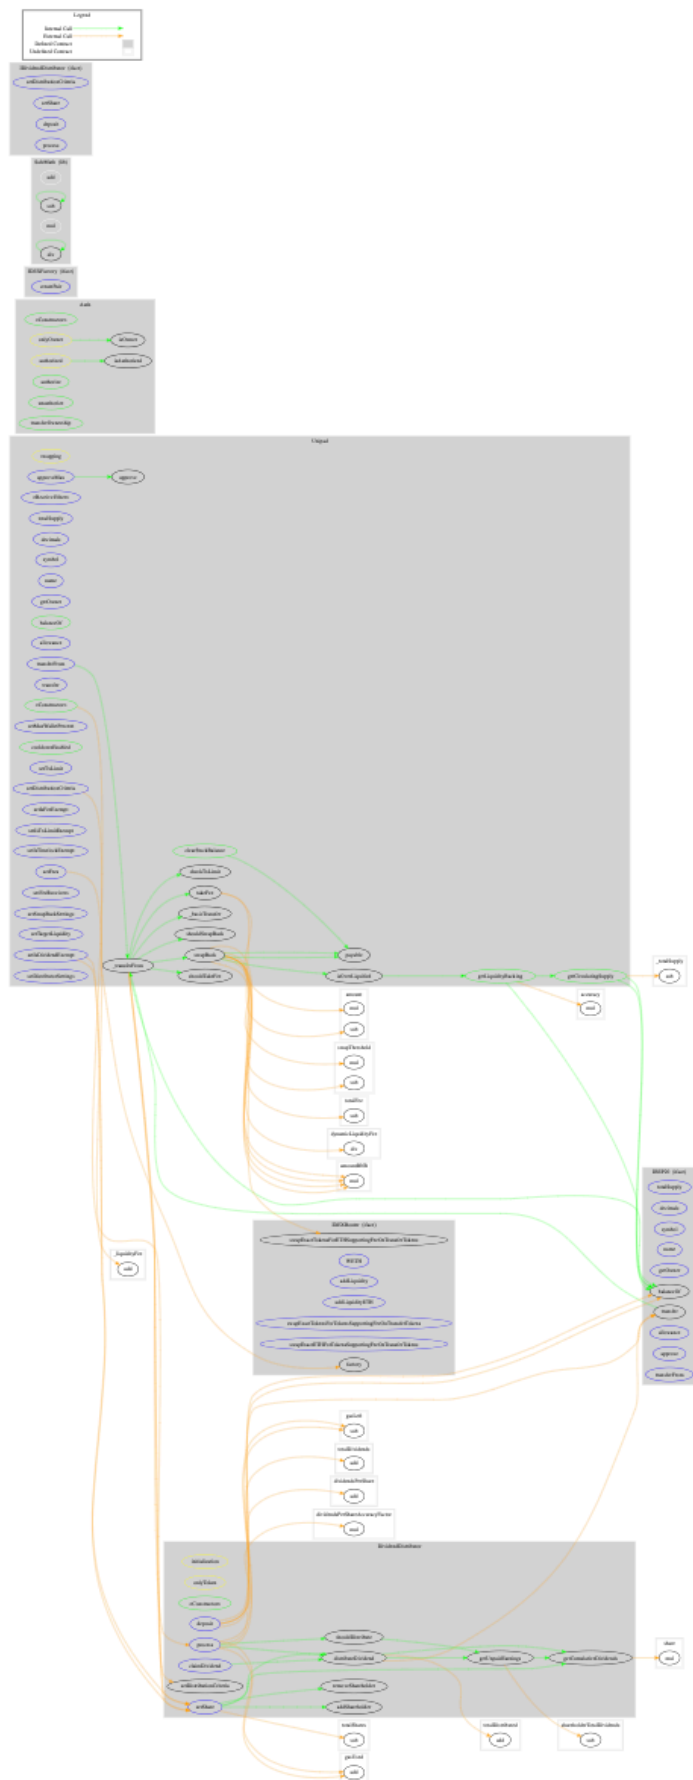

◆ transferOwnership

Ⓜ onlyOwner

## Comments

- Deployer can set following state variables without any limitations
  - `_maxWalletToken`
  - `cooldownTimerInterval`
  - `_maxTxAmount`
  - `liquidityFee`
  - `reflectionFee`
  - `marketingFee`
  - `totalFee`
  - `feeDenominator`
  - `swapThreshold`
  - `targetLiquidity`
  - `targetLiquidityDenominator`
  - `minPeriod`
  - `minDistribution`
  - `distributorGas`
    - Can set to 0, as a result Distributor doesn't call the while-condition in line 314-327 (distribute dividends)
- Deployer can enable/disable following state variables
  - `buyCooldownEnabled`
  - `isDividendExempt`
  - `isFeeExempt`
  - `isTxLimitExempt`
  - `isTimelockExempt`
  - `swapEnabled`
  - `authorizations`

# CallGraph

# Source Units in Scope

## v1.0

Type	File	Logic Contracts	Interfaces	Lines	nLines	nSLOC	Comment Lines	Complex. Score	Capabilities
	contracts/unipad.sol	4	4	726	653	461	41	464	
	<b>Totals</b>	<b>4</b>	<b>4</b>	<b>726</b>	<b>653</b>	<b>461</b>	<b>41</b>	<b>464</b>	

### Legend

Attribute	Description
Lines	total lines of the source unit
nLines	normalized lines of the source unit (e.g. normalizes functions spanning multiple lines)
nSLOC	normalized source lines of code (only source-code lines; no comments, no blank lines)
Comment Lines	lines containing single or block comments
Complexity Score	a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces, ...)

# Audit Results

# AUDIT PASSED

## Critical issues

**No critical issues**

## High issues

**No high issues**

## Medium issues

**No medium issues**

## Low issues

Issue	File	Type	Line	Description
#1	Main	Contract doesn't import npm packages from source (like OpenZeppelin etc.)	-	We recommend to import all packages from npm directly without flatten the contract. Functions could be modified or can be susceptible to vulnerabilities
#2	Main	A floating pragma is set	11	The current pragma Solidity directive is „^0.7.4“.
#3	Main	Missing Zero Address Validation (missing-zero-check)	88, 688	Check that the address is not zero

#4	Main	State variable visibility is not set	200, 208, 210, 212, 214, 215, 216, 229, 230, 231, 232, 234, 392, 393, 394, 396, 397, 403, 407, 408, 410, 411, 412, 413, 419, 425, 426, 433, 434, 442, 445	It is best practice to set the visibility of state variables explicitly
#5	Main	Raw math arithmetic	520, 527, 308, 341, 344, 441, 508	Don't use raw math arithmetic because of overflow/underflow below pragma version 0.8.x  Use instead SafeMath library
#6	Main	Missing Events Arithmetic	255, 679, 693, 698, 653	Emit an event for critical parameter changes
#7	Main	Authorization issue	88-92	Unauthorize old owner after transferring ownership because if the owner transfer the ownership the old owner is still able to use functions with authorized modifier  For more information look at the Modifier section above

## Informational issues

Issue	File	Type	Line	Description
#1	Main	State variables that could be declared constant (constable-states)	210, 224, 231, 393, 445, 396, 397, 392, 394, 403, 431	Add the `constant` attributes to state variables that never change
#2	Main	Unused return values	613	Ensure that all the return values of the function calls are used and handle both success and failure cases if needed by the business logic

#3	Main	Unused state variables	231	Remove unused state variables
#4	Main	Code with no effect	431	tradingOpen state variable is unnecessary because it cannot be changed  As a result of this the if-condition is unnecessary too in line 514-516
#5	Main	Costly operations in a loop	325	Use a local variable to hold the loop computation result

## Commented Code exist

There are some instances of code being commented out in the following files that should be removed:

Line	Comment
183	// assert(a == b * c + a % b); // There is no case in which this doesn't hold

## Recommendation

Remove the commented code, or address them properly.

## Audit Comments

### 13. January 2022:

- Deployer can take almost everything of the transferred amount by setting totalFee to x and feeDenominator to x-1
- Read whole report for more information
