Disclaimer

<u>SolidProof.io</u> reports are not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. These reports are not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team. SolidProof.io do not cover testing or auditing the integration with external contract or services (such as Unicrypt, Uniswap, PancakeSwap etc'...)

SolidProof.io Audits do not provide any warranty or guarantee regarding the absolute bug- free nature of the technology analyzed, nor do they provide any indication of the technology proprietors. SolidProof Audits should not be used in any way to make decisions around investment or involvement with any particular project. These reports in no way provide investment advice, nor should be leveraged as investment advice of any sort.

SolidProof.io Reports represent an extensive auditing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology. Blockchain technology and cryptographic assets present a high level of ongoing risk. SolidProof's position is that each company and individual are responsible for their own due diligence and continuous security. SolidProof in no way claims any guarantee of security or functionality of the technology we agree to analyze.

Description

The driving force behind global crypto adoption

Project Engagement

During the 18th of December 2021, **ArchAngel Team** engaged Solidproof.io to audit smart contracts that they created. The engagement was technical in nature and focused on identifying security flaws in the design and implementation of the contracts. They provided Solidproof.io with access to their code repository and whitepaper.

Vulnerability & Risk Level

Risk represents the probability that a certain source-threat will exploit vulnerability, and the impact of that event on the organization or system. Risk Level is computed based on CVSS version 3.0.

Level	Value	Vulnerability	Risk (Required Action)
Critical	9 - 10	A vulnerability that can disrupt the contract functioning in a number of scenarios, or creates a risk that the contract may be broken.	Immediate action to reduce risk level.
High	7 – 8.9	A vulnerability that affects the desired outcome when using a contract, or provides the opportunity to use a contract in an unintended way.	Implementation of corrective actions as soon aspossible.
Medium	4 – 6.9	A vulnerability that could affect the desired outcome of executing the contract in a specific scenario.	Implementation of corrective actions in a certain period.
Low	2 – 3.9	A vulnerability that does not have a significant impact on possible scenarios for the use of the contract and is probably subjective.	Implementation of certain corrective actions or accepting the risk.
Informational	0 – 1.9	A vulnerability that have informational character but is not effecting any of the code.	An observation that does not determine a level of risk

Auditing Strategy and Techniques Applied

Throughout the review process, care was taken to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices. To do so, reviewed line-by-line by our team of expert pentesters and smart contract developers, documenting any issues as there were discovered.

Methodology

The auditing process follows a routine series of steps:

- 1. Code review that includes the following:
 - i) Review of the specifications, sources, and instructions provided to SolidProof to make sure we understand the size, scope, and functionality of the smart contract.
 - ii) Manual review of code, which is the process of reading source code line-byline in an attempt to identify potential vulnerabilities.
 - iii) Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to SolidProof describe.
- 2. Testing and automated analysis that includes the following:
 - i) Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
 - ii) Symbolic execution, which is analysing a program to determine what inputs causes each part of a program to execute.
- 3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
- 4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts.

Used Code from other Frameworks/Smart Contracts (direct imports)

Imported packages:

- ./Context.sol
- ./Pausable.sol
- ./Ownable.sol
- ./IERC20.sol
- ./IUniswapV2Factory.sol
- ./IUniswapV2Pair.sol
- ./IUniswapV2Router01.sol
- ./IUniswapV2Router02.sol

Tested Contract Files

This audit covered the following files listed below with a SHA-1 Hash.

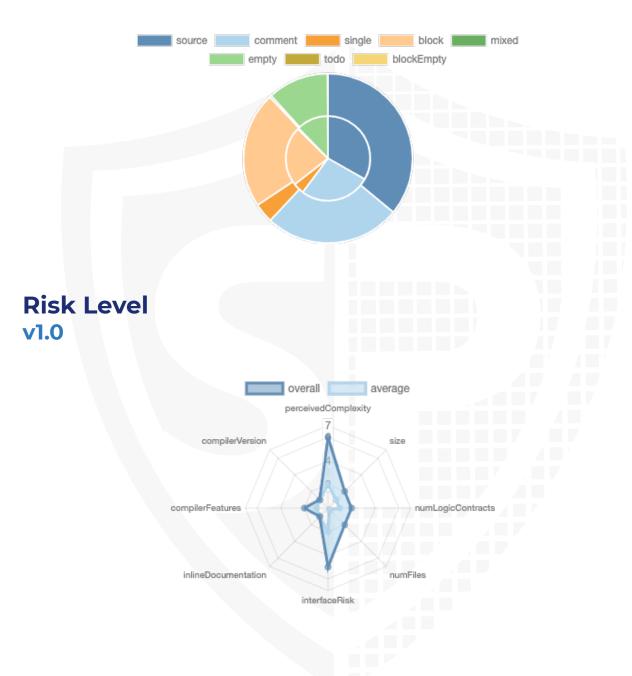

A file with a different Hash has been modified, intentionally or otherwise, after the security review. A different Hash could be (but not necessarily) an indication of a changed condition or potential vulnerability that was not within the scope of this review.

v1.0

File Name	SHA-1 Hash
contracts/IUniswapV2Router02.sol	0d2ae53fa0c621cbc7e0e46e506c562068037f6c
contracts/Ownable.sol	fde041dccf41ea5a60691206ce353db54a3064b9

Scope of Work

The above token Team provided us with the files that needs to be tested (Github, Bscscan, Etherscan, files, etc.). The scope of the audit is the main contract (usual the same name as team appended with .sol).

We will verify the following claims:

- 1. Correct implementation of Token standard
- 2. Deployer cannot mint any new tokens
- 3. Deployer cannot burn or lock user funds
- 4. Deployer cannot pause the contract
- 5. Overall checkup (Smart Contract Security)

Inheritance Graph v1.0

Verify Claims

Correct implementation of Token standard

Tested	Verified
√	√

Function	Description	Exist	Tested	Verified
TotalSupply	provides information about the total token supply	\checkmark	√	\checkmark
BalanceOf	provides account balance of the owner's account	\checkmark	√	\checkmark
Transfer	executes transfers of a specified number of tokens to a specified address	√	√	√
TransferFrom	executes transfers of a specified number of tokens from a specified address	√	√	√
Approve	allow a spender to withdraw a set number of tokens from a specified account	√	√	√
Allowance	returns a set number of tokens from a spender to the owner	√	1	✓

Comments

- · Deployer can set following state variables without any limitations
 - _taxBurn
 - _taxBurnDecimals
 - _taxReward
 - _taxRewardDecimals
 - _taxLiquify
 - _taxLiquifyDecimals
 - _taxMarketing
 - _taxMarketingDecimals
 - maxSellAmountPercent
 - maxSellAmountNormalTax
- · Deployer can enable/disable following state variables
 - _autoBurnEnabled
 - _rewardEnabled
 - _marketingRewardEnabled

Legend

3	
Attribute	Description
Lines	total lines of the source unit
nLines	normalized lines of the source unit (e.g. normalizes functions spanning multiple lines)
nSLOC	normalized source lines of code (only source-code lines; no comments, no blank lines)
Comment Lines	lines containing single or block comments
Complexity Score	a custom complexity score derived from code statements that are known to introduce code complexity (branches, loops, calls, external interfaces,)

Audit Results

AUDIT PASSED

Critical issues

- no critical issues found -

High issues

- no high issues found -

Medium issues

Issue	File	Туре	Line	Description
#1	Main	Unchecked tokens transfer	1431	Use `SafeERC20`, or ensure that the transfer/ transferFrom return value is checked
#2	Main	State variables shadowing and redeclaration	1443-1445, 1449, 1453	Remove the state variable shadowing We recommend to put ARCHA contract marked variables into the constructor to change it in ExtendedReflections or rename those variables

Low issues

Issue	File	Type	Line	Description
#1	Main	Contract doesn't import npm packages from source (like OpenZeppelin etc.)		We recommend to import all packages from npm directly without flatten the contract. Functions could be modified or can be susceptible to vulnerabilities
#2	Main	A floating pragma is set	3	The current pragma Solidity directive is ""^0.8.2"".

#3	Main	Local variables shadowing	537, 411	Rename the local variables that shadow another component
				Modify owner to owner_

Informational issues

Issue	File	Туре	Line	Description
#1	Main	State variables that could be declared constant (constable-states)	1449, 1451, 1452, 1453, 1461, 1443, 1448, 1446, 1445, 1444, 1441	Add the `constant` attributes to state variables that never change
#2	Main	Unused return values	935	Ensure that all the return values of the function calls are used and handle both success and failure cases if needed by the business logic
#3	Main	Functions that are not used	847	Remove unused functions
#4	IUniswa pV2Fact ory	SPDX is missing	-	Add SPDX License to source file
#5	IUniswa pV2Pair	SPDX is missing	-	Add SPDX License to source file
#6	IUniswa pV2Rou ter01	SPDX is missing	-	Add SPDX License to source file
#7	IUniswa pV2Rou ter02	SPDX is missing		Add SPDX License to source file

Commented Code exist

There are some instances of code being commented out in the following files that should be removed:

Line	Comment
1136	// excludeAccountFromReward(uniswapV2Pair_);
1142	// excludeAccountFromFee(uniswapV2Pair_);

```
// function sendFeeToAddress(address addr, uint256 rAmount, uint256 tAmount) private {
// if (_isExcludedFromReward[addr])
// _tokenBalances[addr] += tAmount;
// _reflectionBalances[addr] += rAmount;
// }
```

Recommendation

Remove the commented code, or address them properly.

Audit Comments

21. December 2021:

- · Deployer can lock user funds
- · Read whole report for more information

SWC Attacks

ID	Title	Relationships	Status
<u>SW</u> <u>C-1</u> <u>36</u>	Unencrypted Private Data On-Chain	CWE-767: Access to Critical Private Variable via Public Method	PASSED
